US-CL-CURRENT: 707/4

ABSTRACT:

Systems and methods are herein disclosed for assessing the staleness of a web page. In particular, in one method of the present invention, the staleness of a web page is assessed by examining internal date references within the web page. In another method of the present invention, the staleness of a web page is assessed by examining the meta-data associated with the web page. In a further method of the present invention, the staleness of a hyperlinked web page is determined by examining the link status of the hyperlinks. If the web page has a relatively large number of dead links, it is assessed as being a stale web page. In a still further method of the present invention, the link status of web pages in the neighborhood of the web page being assessed is likewise examined.

---------- KWIC ---------

Description of Disclosure - DETX (27):

[0045] A dead web page is a page that is not publicly available over the web. A page can be dead for any of the following reasons: (1) its URL is malformed; (2) its host is down or non-existent; or (3) it does not exist on the host. The first two types of dead pages are easy to detect: the former fails URL parsing and the latter fails the resolution of the host address. When fetching pages that are not found on a host, the web server of the host is supposed to **return an error**; typically the **error message returned** is the 404 HTTP **return** code. However, it turns out that many web servers today do not **return an error** code even when they receive HTTP requests for non-existent pages. Instead, they **return an OK** code (**200**) and some substitute page; typically, this substitute is an **error message** page or the home-page of that host or even some completely unrelated page. Such non-existent pages that cause a server to issue the foregoing result are called "soft-404 pages".

See what i mean ↑ no one goes into detail

I've even searched 'soft-404' extensively
